

## Raised Storage Area's

### Roll Post Supported

This system combines the versatility of the modular CI-180 with a range of new components to create either a walkway or a platform two-tier solution or extended upward for high rise storage.

Like CI-80, this system simply bolts and clicks together to produce a simplistic storage solution. Accessories like staircases, pallet gates and steel grate floors combine to maximise floor space and utilise vacant headroom. Ideal for businesses that need to make the best possible use of floor space and overhead room where the items stored are small in size and light to medium weight.

### Longspan Supported

Longspan two-tier is flexible and robust with a wide variety of applications, such as archives, factories and retail outlets.

It's readily customised to specific requirements; bay lengths can be mixed and matched, staircases added, along with pallet gates, bridges and anything else your space needs. Suitable for heavier, bulkier items.

### Rack Supported

Utilising your existing racking support structure, create tiered platforms to facilitate picking access at multiple levels.

The platforms are constructed from either mesh grated steel or ply flooring. You can also incorporate conveyors for efficient material flow. Ideal for businesses that need a cost effective way of creating a raised storage area for hand-loaded goods that are not heavy in nature. Slow moving stock can be stored on upper levels leaving the ground floor for fast moving stock items. Also, it suits growing businesses that may need to dismantle and relocate the storage area in the future.

## Raised Storage Area's

### Structural Steel Supported

A raised platform made from structural steel is so strong you only need a limited number of pillars.

This enables you to achieve uninterrupted space above and below which offers unlimited flexibility for utilisation of space. For example, you may want to utilise the ground floor as a workshop, for storage or manufacturing or packing area.

All staircases strictly adhere to the requirements of AS1657-1992. Can be supplied with either timber or steel treads.

Powder coated pallet gates are a great way to create safety barriers for entrance ways on mezzanines and other elevated work areas, whilst still allowing efficient pallet movement.

Handrails and kickplates provide a level of fall protection and safety to other users.
